Bloom - actual design iteration

Before: supplied UI concept (not a built-app screenshot). After: actual October 26 release capture with explicitly labeled synthetic test records. No peer observation or historic screenshot is invented.

Supplied concept / design input

Actual installed release / saved test completion

Verified technical revision, peer evidence still missing

The original concept supplied the cream/sage palette, generous cards, simple plant and calm completion feedback. The actual app preserves that direction and derives garden/counts from saved records, with a semantic progress bar and explicit text status. Those are real design-to-implementation differences, not a claim of a peer experiment.

The Android acceptance runner encountered a keyboard-obscured tap. The runner was corrected to dismiss/unfocus the real keyboard before hit-testing; the UI scroll view also gained drag-to-dismiss keyboard behavior. Git b056775 has no keyboardDismissBehavior; tested source 2cf89bc contains ScrollViewKeyboardDismissBehavior.onDrag. This is an evidence-supported automated-test-driven change, not a fabricated peer request.

Before evidence: docs/verification/android_pixel_keyboard_failure.txt and original widget source in Git. After evidence: actual passing Android acceptance logs for both AVDs, TEST_LOG.md and the changed widget source. Portrait/landscape, device 1.5x and widget 2x text-scale checks are recorded separately. Core color pair ratios are 6.98:1 and 10.10:1; these are not full accessibility certification.

Required peer usability observation / resulting verified revision: NOT SUPPLIED. A real observer must perform a task, report an actual issue, and the team must preserve genuine before/after evidence and verification. Do not present this technical comparison as completing that peer requirement.
